

Dark Matter and Dark Energy in our Universe, Do they Affect our Consciousness?

Electric Universe

According to present scientific cosmological theories only 5% of our universe is composed of ordinary matter made up of Atoms, whereas 23% is Dark Matter and the remainder 72% is described as Dark Energy.

The Dark Matter and Dark Energy are “Enigmas” in yet they are yet to be probed and examined; our knowledge of The Universe presently is restricted to a meager 5% only.

The history of explaining our Universe has in it three revelations, the first being that the earth was the center, the second revelation indicated the earth and planets orbited the sun, whereas the third revelation states that our galaxy is in constant motion in a growing and exponentially expanding

universe, the fourth revelation will probe and examined these portions of dark elements in our Universe and will change completely our scientific understanding. Currently it is hoped that experiments taking place in the The International Space Station may reveal information about these Dark Entities.

It's taken 2500 years from the discovery of the idea of the Atom of Democritus to the present, but it is hoped with our present sophisticated equipment we can greatly shorten the time of further discovery.

I myself wonder what effect this Dark Invisible Matter or Dark Energy has on my Consciousness and more.
